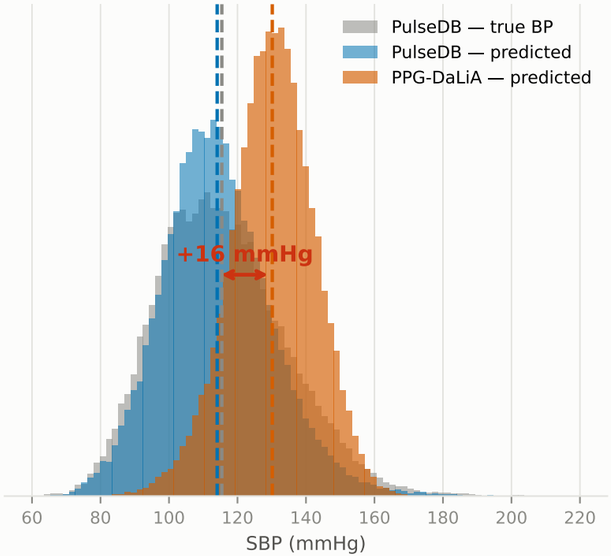
1D-CNN trained on PulseDB, run on PPG-DaLiA — 64,682 clips from 15 volunteers. Only 0.00% of answers are physiologically impossible, but the whole distribution has moved 16 mmHg.

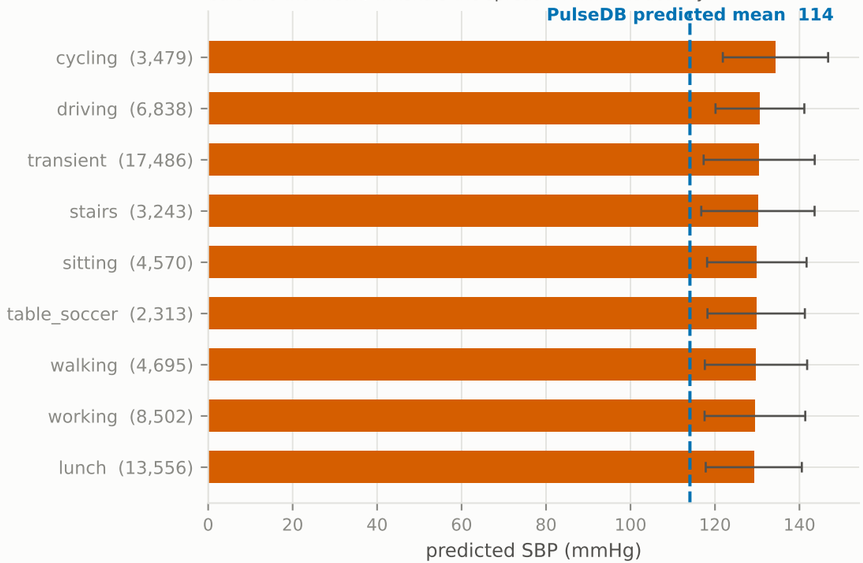
Where the predictions land

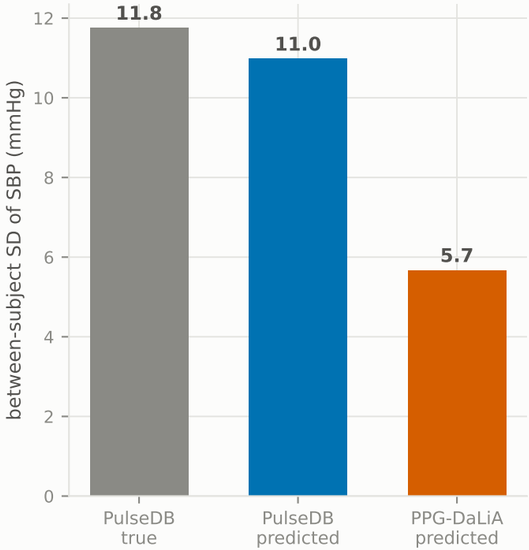
the same model, on ICU patients and on a wrist watch



By what the volunteer was doing

bars are the mean, whiskers the spread within that activity



Can it still tell people apart?


lower means everyone gets the same answer
